Economic Development Division

Contaminated Properties Update

October 1, 2026

The Washington State Department of Ecology (WADOE) Confirmed and Suspected Contaminated Sites List includes over 14,000 properties listed statewide. This list includes sites which still require cleanup and sites which require no further action (NFA). There are 33 sites in Lakewood which still require cleanup. There are 78 sites in Lakewood listed as NFA.

Many of the contaminated sites that are located within Lakewood's borders are listed as 'Tacoma' addresses on the [ecology.wa.gov](https://ecology.wa.gov/contaminated-sites-map) contaminated sites map. Sites listed as Tacoma addresses were generally created before Lakewood was incorporated. All sites within Lakewood that still require cleanup or have achieved NFA status are included in this report.

WADOE has used the Washington Ranking Method (WARM) to rank contaminated sites. On August 23, 2023, Ecology adopted the Site Hazard and Ranking Process (SHARP). SHARP includes separate scores for soil, groundwater, surface water, sediment, and indoor air.

No sites were added as contaminated since the August 2025 update.

One site was given a status of "No Further Action" since the last report:

- [Kens Tire – Site ID: 25942345](#)

113 total sites within Lakewood:

- 78 properties in Lakewood have a status of 'No Further Action'.
- 33 properties in Lakewood are still listed as contaminated and require cleanup.

Cleanup of contaminated sites may take several years, depending on the extent of the contamination. Most sites are cleaned by private property owners, rather than by public agencies.

This report includes site types, site locations, site statuses, cleanup processes, responsible parties, what has been done, what the City is obligated to do, and what the City can do to clean up contaminated sites.

Types of Contaminated Sites and Oversight

There are two main types of contaminated sites to consider:

Superfund: Uncontrolled or abandoned sites or properties where hazardous waste or other contamination is located. A contaminated site is generally considered a "Superfund site" if the federal government is or plans to be involved in cleanup efforts. There are two such sites

that touch incorporated Lakewood: [American Lake Gardens](#) (now listed as No Further Action) and [Lakewood Ponders Corner](#).

USTs: Underground storage tank (UST) sites contamination from petroleum products or Superfund hazardous substances released from underground storage tanks. Tacoma Pierce County Health Department (TPCHD) works with the Washington State Department of Ecology (WADOE), property owners and local jurisdictions on these sites. Lakewood has several UST contaminated sites.

95% of all sites statewide have some type of petroleum contamination.

Brownfields:

Brownfields have a presence of a potentially hazardous substance, pollutant, or contaminant that may complicate real property expansion, development or reuse. Washington State Department of Ecology is the lead agency (WADOE).

The term 'Brownfield' has no regulatory meaning. A municipality may declare a site a brownfield site under several conditions:

- The site is currently abandoned, derelict, or blighted
- Contamination or possible contamination due to the history of the site is affecting development efforts (e.g. the site was formerly a gas station and the status of the underground storage tanks is unknown, causing developers to balk on potential redevelopment projects)
- The municipality has a path to ownership for the property; and,
- Redevelopment is planned for the site

The brownfield program is intended to assist government entities in revitalizing brownfield sites through competitive grants. This program is not intended for use by private investors.

The following EPA Confirmed and Suspect Contaminated Sites are accessible online via this web link: [Lakewood Contaminated Sites](#)

Priority Contaminated Sites:

The following is an update on the three contaminated sites within the Downtown Subarea as of October 1, 2026. These sites were identified as high priority due to potential for redevelopment in the Downtown.

Priority Contaminated Sites Update				
Site	Parcel Numbers	Property Usage	Environmental Background	Status/Notes
BG Olson, 9152 Gravelly Lake Dr SW	5130001350	Commercial office, building remains	Heating oil released during removal of associated underground storage tank	Awaiting Cleanup – status unknown. Site ID: 21046
Ken's Tire, 9601 Gravelly Lake Drive SW	0219022143	Former Automotive service facility; Currently vacant land	UST removed from site with follow-on investigation of dry-well and oil-water separator. Confirmed presence of petroleum products, petroleum related constituents, and halogenated solvents in soil. Suspected in groundwater.	No Further Action. Site has been cleaned up. Site ID: 25942345 Property purchased by Harborstone Credit Union in 2026
Lakewood Towne Center	4002240010 4002240090 4002300090	Previously Lakewood Mall; area has since subdivided and been redeveloped to power center	Multiple dry cleaners operated in the mall. Groundwater contamination confirmed with chlorinated solvents, and soil contamination by same suspected.	May 22, 2023 - WADOE accepted the application to the standard process of the Voluntary Cleanup Program (VCP) for the Lakewood Towne Center Facility (Site). The agreement is effective as of 4/18/2023. June 16 th , 2025: SHARP assessment Final monitoring underway. Site ID: 7922231

Active Contaminated Sites:

NFA = No Further Action; NFA means that the owner has met target cleanup levels for use, and the government does not consider the contamination worthy of attention. NFA does not necessarily mean ready for all uses. NFA status may change.

Cleanup Process

The variables that go into the cleanup process are unique to each site. The following are typical processes to follow.

1. A local government official identifies a Brownfield site that has redevelopment potential. What can you do?
 - Gather information about the history and past uses of the property;
 - Identify the property owner;
 - Work with the owner to encourage development, and to provide resources;
 - Encourage the owner to join the VCP and act as a liaison between the owner, agencies, and resources to assist in this process;
 - Ensure that the community supports this project through proper zoning and noticing as required;
 - Work with the owner through the cleanup process to ensure they complete the process;
 - Act as an ombudsman throughout the cleanup, and development processes.
2. What if the owner cannot be found or does not respond?
 - If property taxes are delinquent, government may repossess the property;
 - If the property is a public nuisance, the local government can take action to abate the hazards, and recover expenses plus fees and taxes from the owner, and failure to reimburse may allow the local government to foreclose;
 - Issue warnings to the property owner and/or civil citations with monetary penalties to the property owner (see more on what the City can do on page 8).

Depending on the amount and type of contamination, it could take many years to complete these projects. WADOE must have four quarters of reporting at levels below minimum cleanup in order to designate the property as NFA. This does not mean the property is completely useless. There are some situations where a property is allowed to be used, but there are restrictions on its use, and/or there is ongoing monitoring required.

Funding Options

*NOTE: Private property owners are not eligible for grants. The City could apply for grants, but would need to be the property owner or have intent to purchase the property. We are not recommending that the City do this due to potential legal implications. **These grants are for informational purposes only.** The majority of properties are cleaned up by private owners.*

The Remedial Action Grant Program has the following opportunities on a biennial basis:

- [Area-wide groundwater investigation grants](#): provide funding to local governments to investigate known or suspected areas of groundwater contamination caused by multiple releases of hazardous substances. These grants are intended to facilitate the cleanup and redevelopment of multiple properties located within the impacted areas by addressing issues that would be difficult to resolve on a site-by-site basis.
- [Safe Drinking Water Action Grants](#): to assist in providing safe drinking water to persons served by private wells or public water systems impacted by a contaminated site.
- [Oversight Remedial Action Grants](#): provide funding to local governments that investigate and clean up contaminated sites under an order or decree overseen by Ecology under MTCA or by the U.S. EPA under the federal cleanup law.

The next application cycle will be the 2027-2029 biennium. Ecology has not yet announced the exact application start date, but based on the biennial schedule, the solicitation will likely open in 2027 (often in early Spring or Summer).

Other grants that are available are:

- [Independent Remedial Action Grants](#) (IRAGs): An independent remedial action is a cleanup action completed voluntarily – that is, a cleanup not under an enforcement order, agreed order, or consent decree. IRAGs are available to help local governments offset costs of cleaning up sites independently.
- [Integrated Planning Grants](#) (IPG): Local Governments that own or are considering acquisition, cleanup and adaptive reuse of a brownfield property, or multiple properties within a defined area, may be eligible for a Standard IPG to facilitate remedial action and adaptive reuse of the property(s) following remediation. **There are no open applications at this time.**

[Washington State Department of Commerce Revolving Loan Fund](#) is available to local and regional governments, non-profit agencies and private businesses for cleanup and redevelopment.

[Liability for brownfields](#) fall to not only the current property owner, but also to previous property owners if they were responsible for the contamination. The City is obligated to ensure that any redevelopment and/or new tenants that take possession of property are protected, including patrons of those tenants when the City has been made aware of the contamination.

City Obligation

If the City is aware that a site is contaminated it is obligated to regulate reuse of these properties in order to protect the health of persons and the environment. This includes change of use, tenant improvements to existing structures, and redevelopment of the property. Storm water compliance officers are also responsible for working with property owners, WADOE and others when hazardous spills or leaks occur to ensure proper handling and cleanup.

What is the City Currently Doing?

- Updates to the contaminated sites report and analysis of properties
- Working with DOE to provide details on each site, and to assist in getting access to these sites as requested for further evaluation;
- Working with TPCHD on USTs, including site updates, and outreach to property owners;
- Working with DOE on hazardous spills (Public Works Engineering);
- Code enforcement through CSRT and in coordination with our Housing Program Manager and Building Official; and
- Monitoring and regulating sites for redevelopment activities to ensure proper and safe management of land use, and redevelopment efforts.

What can the City do?

The City can legally do any and all of the following:

- 1) Identify and publish the problem properties on the City website;
- 2) Issue warnings to the property owner;
- 3) Issue civil citations with monetary penalties to the property owner; and
- 4) Abate dangerous and nuisance conditions on the property, recovering costs from the owner.

All actions are based on the City's "police powers" granted by the Washington State Constitution, Article XI, Section 11, which states: *Any county, city, town or township may make and enforce within its limits all such local police, sanitary and other regulations as are not in conflict with general laws.*

Generally, the City bases many of its code provisions on state statutes; for example, the following:

- [Chapter 35.80](#) (Dangerous and Unfit Buildings) – [Chapter 15.05 LMC](#) (Adoption of International Codes)
- [Title 8 LMC](#) (Health and Safety + Public Nuisances)
- [RCW 46.55.240](#) (Junk Vehicles) – [Chapter 8.26 LMC](#) (Junk and Nuisance Vehicles)

Lakewood Water District Actions (LWD)

The Ponders Wellfield Treatment station was fully completed 2019/2020 to address requirements for this Superfund site.

The project included three main components:

- New booster pump station
- Two new stripping towers
- 4 granular activated carbon (GAC) filtration Vessels. These filters remove PFAS* contamination that has migrated to the wellfield.
- The District's 2026 adopted capital budget includes \$330,000 Ponders GAC Media Replacement.

Representatives from the 28th & 29th legislative districts secured \$5.6M in funding for the Scotts Wellfield filtration project. This site is just east of the railroad tracks off of 108th Street SW and west of Rainier Ave SW. Filtration was installed in 2022 to remove PFAS from the wells. The filtration facility is larger than the Ponders site. LWD continues to coordinate with the EPA the City of Lakewood, and other government entities to keep water quality high in our communities. The District drilled a new production well, G-4. The District's 2026 capital budget assigns \$1.3 million to the G-4 well-equipping project, with funding from the Department of Commerce's Defense Community Compatibility Account (DCCA).

Ongoing Work

1. Update site evaluations, including an analysis of liability;
2. Obtain updated site access authorizations for each site and provide to WADOE;
3. Inform and work with TPCD on UST/petroleum site status and progress;
4. Prioritize sites that are in our target areas for redevelopment, and that are most easily pushed toward NFA designation (*low hanging fruit*);
5. Encourage continued cleanup; and
6. Secure the services of a specialized legal firm as a resource, if needed.

**What are PFAs? Polyfluoroalkyl substances that are man-made chemicals widely used for their properties, such as being resistant to heat, water, and oil. These chemicals came into mainstream use in the 1950s and have been used for non-stick cookware (ex. Teflon), stain resistant fabrics and carpeting, waterproof clothing (ex. Scotchgard, Gore-tex), personal care items like shampoo, and firefighting foams (ex. used near air bases and airports).*
